

Unsatisfied with your current document input system, but don't have a budget to explore or invest in alternatives?

A document input system is the front-end of your document management system. This front-end allows you to classify and index the documents. Some systems extend this to also extract fuller document data for later use.

A document management system without correct and cost-effective document input is about as useful as storing paper files in a salt mine. You know the documents are in there somewhere, but finding and using them can be near impossible.

Automated document classification and automated index and data extraction allow you to cost-effectively

1. Turn incoming documents into quickly processed transactions, and
2. Extract strategic business information from your stored documents.

AliusDoc is so sure our AD-SCI™ can handle your most complex, time-consuming, and error-prone documents that we'll prove it to you with a **FREE Proof-of-Concept (POC)**. Just supply us some sample documents, and we'll show you how easy and quick it is to get dramatically better results.

Rolling out to production can start saving you money immediately with our pay-as-you-go / SaaS pricing model (or you can choose traditional capital purchase for longer-term savings).
